

Abstract of the Disclosure

10           A roller assembly for a sheet material transport assembly is disclosed,  
wherein skewing of the transported sheet material relative to the transport  
assembly is reduced. The roller assembly includes an elongate shaft having a  
compliant layer disposed about the shaft. A relatively non-compliant layer is  
disposed about the compliant layer to form a tire, wherein the non-compliant layer  
15 has a circumference, which is substantially unchanged upon operable loading of  
the roller assembly.
